

To whom it may concern

Uster, 23. July 2026

Extension of Validity of EPDs of Naue products to December 2028

Dear Sir or Madam,

according to Mr. Henning Ehrenberg, Naue GmbH & Co. KG, the production processes at Naue have not changed since the last edition of the Group EPDs established by treeze Ltd., published in 2024. The only change is that energy use has started to switch and will continue to be gradually converted to renewable energy.

This change would result in lower environmental impacts compared to those published. Hence, the last edition of the Group EPDs established by treeze Ltd. can be considered conservative in terms of environmental impacts per declared unit.

Based on this information, its assessment as well as the key characteristics of these EPDs, I confirm that their **validity** can be extended by three years until **December 2028**.

This belongs to:

- EPD-Bentofix, 16.07.2024
- EPD-CARBOFOL, 16.07.2024
- EPD-Secudrain, 16.07.2024
- EPD-Secugrid PET and Secugrid PP, 16.07.2024
- EPD-Secumat, 16.07.2024
- EPD-Secutex, 16.07.2024
- EPD-Secutex H 16.07.2024

Thank you very much for your attention to this matter.

CEN standard EN 15804:2012+A2:2019 serves as the core PCR
Independent verification of the declaration and data, according to EN ISO 14025:2010 ☒ internal ☐ external

1 General aspects

This Environmental Product Declaration (EPD) is commissioned by Naue GmbH & Co. KG and accomplished by treeze Ltd. in 2020. The study has been conducted according to the requirements of the standard EN 15804:2012+A2:2019 (EN 15804 2019) and IES product category rules (IES 2018). The investigated products are the Naue geosynthetics Secutex® intended for the use in many fields of civil engineering including landfill engineering and hydraulic engineering.

This EPD is a revision and extension of a work done in 2017 for the same kind of geosynthetics (Naue 2017). In comparison to 2017, the data are evaluated based on new background inventory where available. Furthermore, in this revision also the “end of life stage” (C1 – C4) is evaluated.

2 Product

2.1 Description and Application

The investigated products belong to the Naue product family Secutex® intended for the use in many fields of civil engineering. The raw material and energy demand are based on the annual production of Secutex® and does not reflect a specific product but the product family. The classification number according to the UN CPC classification system is 36950.

Secutex® geosynthetics are used in many fields of civil engineering including hydraulic engineering, landfill engineering, road construction and tunnel construction. As a separation layer, Secutex® prevents individual and distinct granular layers from contaminating

one another. Thus, structural fill and base courses maintain their integrity for a substantially longer period of time than otherwise possible. Secutex® functions as a filter, preventing fine soil particles from washing through and compromising the drainage ability of the coarser layers, when fine soil layers are present next to drainage layers on highway or railway construction projects. Displacement of small amounts of water in problem areas is facilitated by the in-plane Secutex® transmissivity. Secutex® nonwoven geosynthetics with a high mass per unit area can also protect geomembranes or pipes against mechanical damage. If necessary, a woven geosynthetic can be integrated into the matrix of Secutex® to distribute dynamic loads and thus augment its protective abilities.

Fig. 2.1 Graphical overview of the life cycle stages covered by the EPD of geosynthetics

2.2 Raw material (A1)

The geosynthetic product Secutex® is manufactured using polyethylene terephthalate (PET) and polypropylene (PP) as raw materials. The geosynthetic consists of 100 % PP, 100 % PET or a mixture of both. In most cases 100 % PP is used in the average production of the product family Secutex® in the year 2019. More detailed information on the materials used is shown in Tab. 2.1.

2.3 Upstream transport (A2)

The transport to the manufacturer (A2) considers transports of raw materials to the Naue manufacturing site. The raw materials are transported from the producer to the Naue's production site by lorry only. The average shipping distance for PP is 1070 km.

2.4 Manufacturing (A3)

Secutex® is made of extruded polypropylene and/or polyester fibres connected by a needle punching technology to form a homogenous filter geotextile. Manufacturing includes energy and working materials consumption, a share of the infrastructure (factory hall and office building), product packaging as well as disposal of production wastes (scrap, lubricating oil, and municipal waste). The manufacturing site is in Germany. Therefore, the German consumption mix at low voltage level is used to model the electricity use in manufacturing. The consumption mix displays the electricity domestic net production including imports. No secondary plastics are used. The production wastes are reported to be about 1.1 % relative to the material input.

2.5 Downstream transport (A4)

Transports from the manufacturer to the construction site, warehouse or the client's location is considered based on the current sales of Naue. Shipping within Europe is realised by lorry and to the rest of the world mainly by means of freight ships. Shipped geosynthetics are transported to port by lorry.

2.6 Construction and installation (A5)

The construction and installation stage considers the mounting of Secutex®. Other processes such as excavation of foundation or ground compaction are outside the system boundary. The diesel consumption of mounting the geosynthetics amounts to 1.04 MJ/m². The raw material input (PP) is higher than the mass per unit area because of wastes during the manufacturing. These wastes are sold to a recycler and do not have to be disposed.

Tab. 2.1 Specific raw material, working material and energy consumption, wastes produced and infrastructure requirements per square meter of average separation layer of the product family Secutex®

Specific material consumption	Specific material and energy use per m²	Unit	Secutex®
Production volume and reference year	Annual production volume	tons	*
	Annual production volume	m²	*
	Reference year		2019
	Mass per unit area	g/m²	339
A1 Raw material	PP	g/m²	342.9
A2 Upstream transport	Lorry, 25 tons	tkm/m²	3.67E-01
A3 Manufacturing (working material and energy consumption)	Working material		
	Lubricating oil	kg/m²	2.98E-06
	Packaging		
	Paper case / cardboard	kg/m²	1.06E-02

	office buildings	m²/m²	2.66E-05
	other sealed area	m²/m²	5.94E-04
	share related to product	%	20%
A4 Downstream transport	Ship	tkm/m²	1.11E+00
	Lorry, 25 tons	tkm/m²	3.26E-01
A5 Construction and installation	Diesel consumption installation	MJ/m²	1.04E+00

Specific material consumption	Specific material and energy use per m ²	Unit	Secutex®
C1 Deconstruction	Diesel consumption deconstruction	MJ/m ²	8.39E+00
C2 End-of-life transport	Lorry, 25 tons	tkm/m ²	1.82E-02
C4 Disposal	Municipal waste incineration, PP	kg/m ²	3.05E-01
	Landfill, PP	kg/m ²	3.39E-02

* filed confidentially, ** tkm/m² - ton-kilometer per m²

2.7 Deconstruction (C1)

The deconstruction as part of the end-of-life processes (C1) covers the on-site dismantling of Secutex®. The diesel consumption of dismantling the geosynthetics amounts to 8.4 MJ/m².

2.8 Transport to product's waste processing (C2)

The end-of-life transports (C2) considers the transportation of the geosynthetics to a recycling site or disposal. On average, Secutex® is transported 54 km to the nearest waste incineration plant or landfill.

2.9 Waste processing (C3)

Secutex® is directly disposed of. That is why no wasted processing is included in the assessment.

2.10 Disposal (C4)

The end-of-life disposal (C4) includes the emissions from waste disposal, physical pre-treatment, and management of the disposal site. Secutex® is disposed of 90 % in municipal waste incineration plants and 10 % in landfills.

3 LCA – Calculation rules

3.1 Declared Unit

The declared unit is 1 m² of separation layer of the product family Secutex® with an average mass per unit area of 339 g/m².

3.2 System boundaries

This EPD is a cradle-to-grave declaration excluding the usage stage. The product system of geosynthetics comprises the product stage (manufacture and supply of raw materials including purchase and inter-company logistics, manufacture of the components and of the product), the construction stage (mounting of the product) and the end-of-life stage (deconstruction, end-of-life transport and disposal).

The comparison of products based on their EPD is defined by the contribution they make to the environmental performance of the building. Consequently, the comparison of the environmental performance of construction products using the EPD information shall be based on the product's use in and its impacts on the building and shall consider the complete life cycle (all information modules).

3.3 Allocation and recycling

Wastes that reach the end of waste state and that are recycled leave the product system without bearing a share of the environmental impacts of the first life cycle. No credits are given for potentially avoided production. Secondary raw materials bear environmental impacts caused by scrap collection and recycling activities. This is in line with the “polluter pays” principle (EN 15804, 2019; IES 2012).

Energy and working materials consumption as well as infrastructure requirements of Secutex® manufacture are allocated according to the m² of the geosynthetics outputs.

3.4 Temporal and geographic validity

The life cycle assessment of Secutex® describes the geosynthetics used worldwide. It is valid for the purchase, production, and distribution situation in the recent past (last two years). All product alternatives described in this report are currently available on the market.

3.5 Background data

Foreground inventory data is mainly based on average annual production data provided by Naue GmbH & Co. for the year 2019. The primary sources of background inventory data are the UVEK LCI data DQRv2:2018 (KBOB et al. 2018). These data are based on the ecoinvent data v2.2 (ecoinvent Centre 2010) and include updates of several background inventory data: electricity supply (Itten et al. 2014; Messmer & Frischknecht 2016a), natural gas supply (Schori et al. 2012), photovoltaics (Jungbluth et al. 2012; Frischknecht et al. 2015a), hydroelectric power generation (Flury & Frischknecht 2012), nuclear power and supply chain (Bauer et al. 2012), oil supply chain (Stolz & Frischknecht 2016a), wood products (Werner 2017), aluminium (Stolz & Frischknecht 2016b) and transportation (Stolz et al. 2016; Messmer & Frischknecht 2016b, c, d). The plastics inventory data of PET and PP refer to the years 1999/2000 and 1999, respectively and are based on data provided by PlasticsEurope (Boustead 2005-07).

The modelling and all calculations are performed with the LCA software SimaPro v9.1 (PRé Consultants 2020)

4 LCA – Results

LCIA results are relative expressions and do not predict impacts on category endpoints, the exceeding of thresholds, safety margins or risks. Impact Category indicators required by the environmental product declaration standard were modelled as follows:

- Climate change – total: Global Warming potential total (GWP-total), Baseline model of 100 years of the IPCC based on IPCC (2013)
- Ozone Depletion: Depletion potential of the stratospheric ozone layer (ODP), steady state ODPs (WMO 2015)
- Acidification: Acidification potential, Accumulated Exceedance (Seppälä et al. 2006, Posch et al. 2008)
- Eutrophication aquatic freshwater: Eutrophication potential, fraction of nutrients reaching freshwater end compartment (EP-freshwater), EUTREND model (Struijs et al. 2009)
- Eutrophication aquatic marine: Eutrophication potential, fraction of nutrients reaching marine end compartment (EP-marine): EUTREND model (Struijs et al. 2009)
- Eutrophication terrestrial: Eutrophication potential (EP-terrestrial), Accumulated Exceedance (Seppälä et al. 2006, Posch et al. 2008)
- Photochemical ozone formation: Formation potential of tropospheric ozone (POCP), LOTOS-EUROS (Van Zelm et al. 2008)
- Depletion of abiotic resources – minerals and metals¹: Abiotic depletion potential for non-fossil resources (ADP-minerals&metals), CML 2002 (van Oers et al. 2002)
- Depletion of abiotic resources – fossil fuels¹: Abiotic depletion potential for fossil resources (ADP-fossil), CML 2002 (van Oers et al. 2002)

¹ The results of this environmental impact indicator shall be used with care as the uncertainties on these results are high or as there is limited experience with the indicator.

- Water use¹: Water (user) deprivation potential, deprivation weighted water consumption (WDP), Available WATER REMaining (AWARE, Boulay et al. 2017)
- Particulate Matter (PM) emissions: Potential incidence of disease due to PM emissions, SETAC-UNEP (Fantke et al. 2016)
- Ionising radiation, human health²: Potential Human exposure efficiency relative to U235 (IRP), Human health effect model as developed by Dreicer (1995) update by Frischknecht (2000)
- Ecotoxicity (freshwater)¹: Potential Comparative Toxic Unit for ecosystems (ETP-fw), USEtox model (DG-JRC 2015)
- Human toxicity, cancer effects¹: Potential Comparative Toxic Unit for humans (HTP-c), USEtox model (DG-JRC 2015)
- Human toxicity, non-cancer effects¹: Potential Comparative Toxic Unit for humans (HTP-nc), USEtox model (DG-JRC 2015)
- Land use related impacts / soil quality¹: Potential Soil quality index (SQP), soil quality index based on LANCA
- Use of renewable and non-renewable energy (cumulative energy demand, CED): reported in net calorific value, as demanded in the product declaration guidelines. For each the total and the two sub-categories “primary energy resources used as raw material” (feedstock) and “primary energy resources excluding use as raw material” are reported.
- The “CED, raw materials used” was assessed on product basis, i.e. the net calorific value of the materials contained in the geosynthetics
- The “CED total, renewable” and “CED total, non-renewable” are calculated with the method published in ecoinvent version 2.0 and expanded by PRé Consultants for resources available in SimaPro 9 database (Frischknecht et al. 2007; Frischknecht et al. 2015b; PRé Consultants 2015).
- Use of secondary materials: based on the feedstock used in the production of the geosynthetics
- Use of renewable secondary fuels and use of non-renewable secondary fuels. Electricity is assumed to contain no secondary fuels.
- Use of net fresh water: Evaporated water is considered with 100%; elementary flows in the background system are accounted for as follows: 10 % of water extracted from water bodies and 10 % of process water used (e.g. Water, lake; Water, process, drinking) and 5 % of cooling water used (e.g. water, cooling, surface).
- Waste, life cycle based: “Hazardous waste” covers hazardous waste deposited in underground storage facilities and is accounted for via the elementary flow of volume occupied in an underground deposit. The density of hazardous waste for the conversion to kg is taken from the ecoinvent report 13-III (Doka 2009). “Radioactive waste” covers low radioactive waste and high and medium radioactive waste. It is assessed likewise via the elementary flows “volume occupied, final

² This impact category deals mainly with the eventual impact of low dose ionizing radiation on human health of the nuclear fuel cycle. It does not consider effects due to possible nuclear accidents, occupational exposure nor due to radioactive waste disposal in underground facilities. Potential ionizing radiation from the soil, from radon and from some construction materials is also not measured by this indicator.

repository for Radioactive waste” and “volume occupied, final repository, low-active waste”, respectively. The density of radioactive waste is taken from Dones (Dones 2007). Non-hazardous waste covers all waste going to landfills. The conversion of the land transformation elementary flows “transformation, to dumpsite” for slag compartment ($22'500 \text{ kg/m}^2$), inert material landfill ($22'500 \text{ kg/m}^2$), sanitary landfill ($20'000 \text{ kg/m}^2$) and residual material landfill ($16'000 \text{ kg/m}^2$), is conducted according to the average depth of the landfill sites and average waste densities given in Doka (2007).

- Materials for recycling: based on the materials wasted in production, i.e. PET and PP sold to the recycling company. The production wastes are reported to be 0.69 % relative to the material input.
- Materials for energy recovery: weight of materials sent to municipal waste incineration plant, i.e. municipal waste.
- Long term emissions are not included in the assessment because of implausible results of the indicator eutrophication.

4.2 Relative contribution of life cycle stages

Fig. 4.1 shows the relative contribution of the different life cycle stages (A1 – A5) to the total impact of the product and construction process stage A of Secutex® geosynthetics. The contribution is shown for the ten core indicators: Climate Change – total, Ozone Depletion, Acidification (AP), Eutrophication aquatic freshwater, Eutrophication aquatic marine, Eutrophication terrestrial, Photochemical ozone formation, Depletion of abiotic resources – minerals and metals, Depletion of abiotic resources – fossil fuels. According to the EPD of 2017 (NAUE 2017) and for comparison purposes, the end of life stage C is not included in Fig. 4.1.

Fig. 4.1 Relative contribution of the different life cycle stages (A1 – A5) to the total impact of the product and construction process stage A of Secutex®

4.3 Data quality

The quality of the data used to model geosynthetics produced by Naue GmbH & Co. KG is high regarding the material composition, the transport logistics and the manufacture of component. Data are provided by Naue GmbH & Co. KG and are reliable and detailed. The manufacturer's data are less than three years old and based on annual averages. The data representing the end of life stage are mainly based on assumptions and thus the data quality is considered to be low. The material supply of plastics is represented by best available data provided by the European Plastics association PlasticsEurope.

The UVEK LCI data DQRv2:2018 (KBOB et al. 2018) are used as background inventory data to complement the product system of geosynthetics. The UVEK LCI data DQRv2:2018 are based on the ecoinvent data v2.2 (ecoinvent Centre 2010) and contain inventory data of many basic materials and services. The database includes the most recent datasets of plastic feedstock. Most of the important background data are less than 10 years old.

Additional data quality considerations are documented within the KBOB LCI and ecoinvent database. A Monte Carlo analysis to assess uncertainties was not conducted. The overall background data quality is appropriate for the use in this LCA.

5 Environmental impacts according to the NMD method

The following table and figure is an extension to the Environmental Product Declaration of Secutex[®], published by Naue GmbH & Co. KG in 2021 (EPD-NAUE-STX-001-ref2 2017). The potential benefits and loads are due to district heat and electricity by MSWI of 90 % of the geosynthetic materials.
